The guided wave is composed of two distinct plane waves traveling at angles θ with the z axis in the y-z plane. Their wavevectors have components $(0, k_y, k_z)$ and $(0, -k_y, k_z)$. Their sum or difference therefore varies with z as $\exp(\pm jk_z z)$, so that the propagation constant of the guided wave is $\beta = k_z = k \cos \theta$.

GUIDED-WAVE OPTICS

The Fiberoptics and Guided-Wave Optics axis is concerned with the development of a new generation of functional optical components based on light confinement inside a guide, either cylindrical (fiber) or planar (integrated optics).

Fiber-optics and guided-wave optics

An optical waveguide is a physical structure that guides electromagnetic waves in the optical spectrum. Common types of optical waveguides include optical fiber and transparent dielectric waveguides made of plastic and glass. Optical waveguides are used as components in integrated optical circuits or as the transmission medium in local and long haul optical communication systems. Optical waveguides can be classified according to their geometry, mode structure, refractive index distribution and material.
